

Group #11:

- DEMO
 - Uses maven to build dependencies, easy set-up, can add this into the readme.md so everyone knows how to do it
 - Have the working indexer and searching on the back end
 - Can create user objects but don't have a working login and sign up functionality
 - UI
 - Have advance search on the ui, with author, tags and other details (:+1:)
 - Have login working on frontend
 - Parser working for pdf, txt, and html files
- JIRA
 - Sprint 1 couldn't complete all sub tasks in user story
 - Sprint 2 added more users stories for the UI into the sprint so it increases
 - Completed most of the tasks but weren't able to get through all of them
 - Suggest splitting user stories into smaller stories and make sure you don't have redundant user stories
